4. Can you describe a lesson in which technology mainly saved time, improved accuracy, or provided faster feedback? How did this benefit learning?
1 response
DeltaMath in my Algebra 1 class to help students practice simplifying expressions and applying the properties of exponents. The technology saves time because it automatically checks students' answers and provides immediate feedback when they make mistakes.

5. Can you describe a lesson in which technology allowed students to perform a substantially different mathematical task?
1 response
In my Geometry class, I used Desmos to teach students how to graph lines and explore the relationships between their equations and graphs. Instead of simply plotting points on paper, students could change the values in an equation and immediately observe how the line moved or changed its slope

6. How do you support students who have limited access to devices, mobile data, electricity, internet connectivity, or accessibility features?
1 response
I use printed worksheet snd give opportunities to complete work in class

7. What do you do when a technological tool produces a correct answer, but students cannot explain the underlying mathematics?
1 response
I ask them to show their work with reasoning ste by step. I let them justify their answers and discuss with partners

8. How do you determine whether technology improved mathematical learning rather than merely increasing participation or enjoyment?
1 response
I compare students' performance before and after using technology through quizzes, exit tickets, and independent practice. I also check whether students can explain their reasoning and solve problems without technology

9. What technological knowledge or skill did you need to develop to teach a particular mathematics topic effectively?
1 response
I developed my skills in using educational technology tools to create interactive math lessons, assess student understanding, and provide immediate feedback.

understanding, and provide immediate feedback.
10. What advice would you give pre-service mathematics teachers about choosing and using technology realistically?
1 response
Choose technology that supports your learning objectives, is easy to use, and is accessible to all students. Always have a backup plan in case of technical issues, and make sure technology helps students understand the mathematics rather than just complete tasks.
