"How technology can support mathematical thinking?"

As a group of future mathematics teachers, we believe that technology plays an important role in improving the teaching and learning of mathematics. It provides opportunities to make abstract mathematical concepts easier to understand through visual representations, interactive activities, simulations, and digital learning tools. With the help of technology, learners can explore mathematical patterns, solve problems, test their ideas, and develop critical thinking and problem-solving skills. It can also encourage active participation and collaboration by allowing learners to engage in meaningful mathematical activities. Through the effective use of technology, we believe that mathematics can become more engaging, understandable, and relevant to learners' everyday lives.

Through our course, Technology for Teaching and Learning in Mathematics, we have gained a deeper understanding of how technology can support mathematical thinking and improve classroom instruction. We learned that digital tools should be selected based on the lesson objectives, learners' needs, and the resources available in the classroom. We also recognized that technology should not replace the teacher's guidance or the learners' own reasoning but should serve as a tool for exploring concepts and developing a deeper understanding. Furthermore, we realized that effective technology integration requires careful planning, creativity, and consideration of possible challenges, such as limited internet access, unavailable devices, and differences in learners' abilities. These insights have helped us understand that technology is most effective when it is used purposefully and responsibly to support meaningful learning experiences.

This portfolio compilation presents our learning experiences, activities, reflections, and insights into the effective integration of technology in mathematics education. It showcases our understanding of how technological tools can help learners visualize mathematical concepts, investigate patterns, communicate their ideas, and develop strategies for solving problems. As a group, we recognize the importance of creating inclusive and learner-centered environments where technology supports different learning needs and encourages active participation. We aim to apply the knowledge and skills we have gained by choosing appropriate tools, providing alternative learning resources when needed, and guiding learners toward understanding mathematical processes rather than simply obtaining correct answers. Ultimately, we believe that technology can support mathematical thinking by helping learners become more curious, confident, independent, and critical thinkers who appreciate the value of mathematics in real-life situations.
